Annual Meeting

The annual meeting of the shareholders of the Company will be held on April 11, 1973, at eleven a.m., in the Crystal Ballroom of the Benjamin Franklin Hotel, Ninth and Chestnut Streets, Philadelphia.

Holders of common stock of record at the close of business March 2 are entitled to vote at this meeting.

Notice of the meeting, proxy statement, and proxy will be mailed under separate cover. Prompt return of the proxies will be appreciated.

Philadelphia Electric Power Company Bonds and Debentures are listed on the PBW Stock Exchange.

To Our Shareholders:

Earnings per share of common stock in 1972 were \$2.08, which was less than the \$2.10 earned in the previous year. Although total earnings of \$86,416,000 were \$8,112,000 better than in 1971, the number of outstanding shares increased by 11 percent, which caused the reduction in per share earnings.

Sales and revenue growth in 1972 did not reach our expectations primarily because of adverse weather, which held down air conditioning usage. Also, slower than anticipated economic recovery held down normal growth in sales to commercial and industrial customers. Damage to our facilities during Tropical Storm Agnes increased expenses by nearly \$2.5 million and penalized earnings by 2.8 cents a share.

Operating costs and capital investment continued to rise in 1972. Rate increases granted in 1971 helped to stabilize our return on investment, although at a lower than satisfactory level. Because of continued higher operating costs and new plant placed in service, we requested additional rate increases for electric, gas, and steam service during 1972. These rate increases are discussed on the following page.

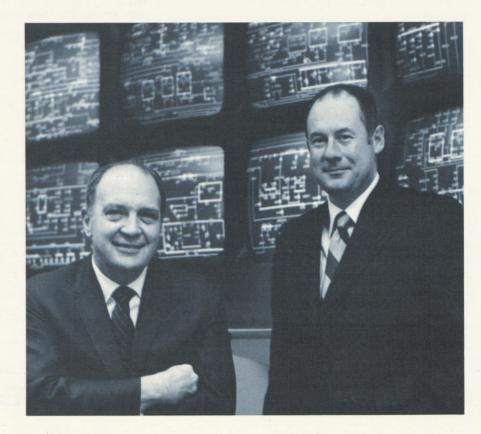

Looking ahead, we expect our electric energy sales in 1973 to return to their historical growth rate of 6 percent, compared with the increase of only 4.5 percent in 1972. Also in 1973, we expect to begin nuclear power generation on a commercial scale. The 1065-megawatt Peach Bottom nuclear unit No. 2, which is scheduled for service by the end of the year, will provide an important source of clean, reliable power.

Plant expansion and improvement will require expenditures of approximately \$3.2 billion in the next five years, compared with \$1.5 billion during the past five years. A major portion of these outlays will be for nuclear generating stations and related high-voltage transmission ties. We are planning for 70 percent of our electric generation to come from nuclear power plants by the mid-1980's.

The management of your Company will continue to serve the public's increasing energy needs in the most reliable and economic way possible and with minimal impact on the environment. Although 1972 was not a favorable year, it was a test of our ability to meet the problems effectively, and your Company continued to grow, continued to expand, and continued to plan for the future. We look forward to continued growth in the years ahead with the prospect of improved business conditions, steady increase in the use of electric power, and improved financial results.

MARCH 5, 1973

CHAIRMAN OF THE BOARD

Robert F. Gilkeson, chairman, and James L. Everett, president.

Financial Summary

Earnings per share in 1972 declined to \$2.08 from \$2.10 in the previous year due to an 11-percent increase in the average number of shares outstanding. Earnings applicable to common stock rose 10 percent to \$86 million.

Dividends paid on the common stock amounted to \$1.64 a share, 78 percent of which was not taxable for federal income tax purposes.

Total revenue rose to a new high of \$685 million, a 13-percent increase over 1971. This increase amounted to \$77 million, of which \$68 million came from electric operations, \$6 million from gas operations, and \$3 million from steam operations.

Operating and maintenance expenses, consisting primarily of fuel, labor, and materials, were up 13 percent, reflecting inflationary pressures and growth in the Company's business.

Investment in new facilities was a record \$400 million, which resulted in a 15-percent increase in total investment to \$2.6 billion. Outlays for the next five years are estimated at \$3.2 billion.

Long-term financing needs during 1972 were met by the sale of a \$75-million issue of 7.80% preferred stock, a \$100-million 7½% mortgage bond issue, \$94 million of common stock, and a \$40-million issue of industrial revenue bonds.

With costs to serve constantly increasing, Philadelphia Electric has been prompt in seeking rate increases for all of its services in order to offset higher costs and to maintain a fair return on its investment in plant and equipment.

Rate Increases

In May 1972, the Maryland Public Service Commission permitted our subsidiary, Conowingo Power Company, to increase its electric rates by \$670,000, or 12 percent. In June, the Pennsylvania Public Utility Commission (PUC) permitted us to increase steam rates by \$1.3 million, or 8 percent.

On July 14, we filed new tariffs with the PUC for all classes of electric service to increase revenues by approximately \$48 million a year, or 9 percent. Of the 9 percent requested, the PUC permitted 3 percent to become effective October 5 as an emergency increase, and suspended the balance pending an investigation, now under way, into the reasonableness of the entire increase requested. On December 30, we were permitted by the PUC to put into effect a new clause in our gas tariff to provide for recovering the additional cost of substitute propane gas we must purchase because of the curtailed supply of natural gas. On December 5, we filed for a general gas rate increase with the PUC amounting to \$12 million,

or 13 percent. The increase be-

came effective on February 15,

1973, subject to possible refund upon conclusion of the PUC's in-

vestigation into its reasonableness.

This was the first general gas rate

increase since 1953.

Million Electric Rate Boost Called "Unjust" by City Aide

Since high gra

crease will affect the transit and commuter operations adversely.

Other opponents of the hike

Do you read beyond the headlines?

Rate Increase Questioned

Look at the news headlines above -there's not a complimentary one among them.

Look at them. Do they reflect the policy or philosophy of Philadelphia Electric? Nothing of the sort -because headlines never really tell the story. Somewhere in the text, far below the headline, the other side of the story may be told. Unfortunately, the majority of readers don't read beyond the headline.

Do we really need rate increases? Do we need to recover costs of premium-priced fuels? Are we asking our customers for more money just to fatten our purses?

Costs of living up

Look at your own costs of living over the past few years. What hasn't gone up? Everything costs more today-food, clothing, automobiles, transportation, recreation, rents, appliances, liquor, taxes—the list goes on and on, and up and up.

The same thing has happened to the cost of generating electricity. One difference is that where your costs have gone up a few cents an item, our costs have gone up by millions of dollars.

The costs for construction, for example, have doubled in the last five years. Fuel prices have jumped 100 percent in just three years due to the use of premium-priced lowsulfur oil to conform with air pollution control standards. Taxes in four years have doubled. The average interest rate on our outstanding bonds and preferred stock has risen from 3.8 percent in 1966 to more than 6 percent in 1972.

Building costs up

Construction expenditures in 1972 were at a record high. In the next five years Philadelphia Electric has scheduled outlays of over \$3 billion. Write it out, and it looks like this: \$3,000,000,000. That's more than a lot of money. It's an enormous amount of money. It's money that has to be raised in the financial market—at high rates of interest.

This tremendous sum is for construction, expansion, and improvement of the Company's facilities. It is for the generating equipment, the substations, the transmission lines needed to take care of the added requirements the public demands. This money has nothing to do with the cost of operating our business-generating the power, getting it to the customers, billing, salaries, and the office work necessary from day to day.

This is where our rates come in. The bills the customers pay go toward operating expenses, plus paying the high interest rates and the added cost of premium-priced fuels. So, when all operating costs to the Company go up, the bills to customers must go up.

As a matter of fact, our ability to borrow the huge sums of money we need for our expansion program depends largely upon our earnings from the sale of electricity. To keep earnings at the proper level, our rates must be adjusted accordingly. This is another fact the headlines neglect to convey.

Rates are up

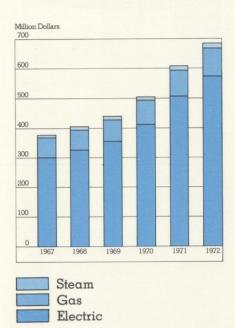

The headlines say: Rates are up! But the story is far from told. There's nothing about the convenience and service the customer gets for his money. Nothing about the relation of the bill to the amount of increased usage by the customer. No mention that the average electric bill is a small percentage of the consumer's total budget. No word that in the face of sharply rising costs, the kilowatthour cost has risen less than other products and the general cost of living.

No. The headlines fail to mention these significant items.

One more thing the headlines fail to spell out. The average person today is buying more electricity than last year, more than the year before, and more than the year before that. It boils down to this: we must be doing something right.

It is our conviction that we are doing a great many things right -and it is our intention to continue doing so-regardless of and despite the headlines.

Operating Revenue

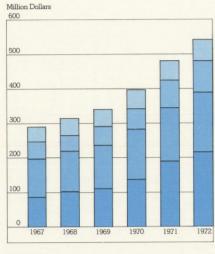

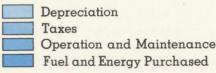

Operating revenue increased \$77 million over 1971 to a record \$685 million. Approximately \$57 million of this increase was attributable to rate increases authorized in 1971 and 1972, and the remainder was the result of increased sales.

	Revenue	
Electric	\$575 million	up 13%
Gas	93 million	up 7%
Steam	17 million	up 22%
	\$685 million	up 13%

All services posted gains in energy sales during 1972. Electric sales were up 4.5 percent, gas sales 2.5 percent, and steam sales 1.3 percent. These increases, however, were below expectations because of slower recovery than anticipated in business conditions, and adverse weather conditions which held down air conditioning usage.

Operating Expenses

Operating expenses increased 13 percent to \$541 million due to growth in business and higher costs of materials and supplies, taxes, wages, and other expenses.

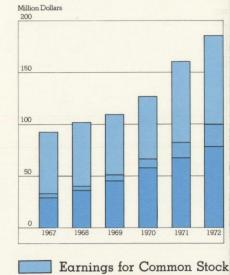

Electric fuel expenses, accounting for more than half of operation and maintenance expense, increased \$15 million, or 10 percent, reflecting the higher cost of low-sulfur oil used to meet environmental regulations, and increased sales. Our cost of natural gas supplied to customers increased \$7 million, or 22 percent, primarily because of higher prices paid to our suppliers.

As a result of heavy rainfall, hydro generation at Conowingo station in 1972 was a record 2.2 billion kilowatt-hours, 32 percent above normal and 29 percent above 1971. The increase over last year accounted for fuel savings of approximately \$3.8 million.

Total taxes amounted to \$94 million, up \$13 million over the previous year. Of the total amount, \$35 million were federal, \$56 million were state, and \$3 million local.

As a result of additional plant in service, depreciation charges were increased \$5 million, 8 percent above 1971.

Income Before Interest Charges

Interest Charges

Interest charges and preferred dividends increased 20 percent, reflecting the high cost of new

capital as well as the large amount

of new financing required by our

continuing construction program.

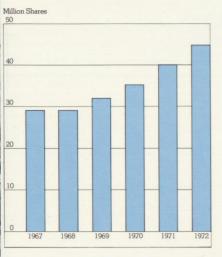

Preferred Dividends

A \$75-million issue of 7.80% preferred stock sold in April, and the full-year effect of the two preferred stock issues sold in 1971 raised total preferred dividend charges to \$22 million.

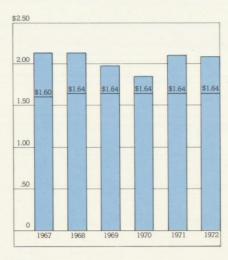

A \$100-million, 7½% mortgage bond issue sold in June, and the full-year effect of the two mortgage bond issues sold in 1971 increased total interest charges to \$78 million.

Earnings available for common stock were \$86 million, a 10-percent increase over 1971.

Common Stock Outstanding

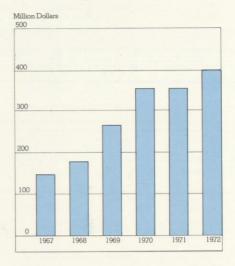

Earnings Per Share

Construction Expenditures

As part of construction financing, the Company has issued 15.7 million new shares of common stock since 1968, 4.6 million shares of which were issued in 1972. These new common shares, together with new preferred stock sold, provide the equity capital needed to maintain the high quality of our bonds. They were issued as part of a program to reduce our debt ratio and strengthen our equity position to provide a sound and conservative financial foundation as we move through the 1970's.

Earnings per share in 1972 declined to \$2.08 from \$2.10 in the previous year, primarily because of higher capital charges on our rapidly growing investment and cooler summer temperatures which held down air conditioning usage.

Dividends paid were \$1.64 per share, representing a 79-percent payout of the \$2.08 earned in 1972. A portion of the dividends paid, 78 percent, represented a return of capital to shareholders for federal income tax purposes and was, therefore, not taxable as ordinary income. The Tax Reform Act of 1969 changed the method of determining taxability of dividends for federal income tax purposes. Consequently, in 1973 the portion of dividends nontaxable will be substantially reduced, and may be eliminated entirely in succeeding years.

Construction expenditures for new facilities were a record \$400 million in 1972. Of this amount, \$362 million was invested in the electric system, \$23 million in the gas system, \$2 million in the steam system, and \$13 million in common facilities. Our total investment in facilities, less depreciation reserve, is now \$2.6 billion and is expected to nearly double by 1977. Our construction program calls for the continuation of substantial investment in new plant, with expenditures of \$523 million planned for 1973. It is expected that expenditures in the coming five years, 1973-1977, will total approximately \$3.2 billion, compared with \$1.5 billion spent in the past five years.

Financing

During 1972, four security issues, totaling \$307.6 million, were sold.

APRIL

Preferred Stock,

7.80% series, 750,000 shares (at par).....\$75 million

JUNE

Mortgage Bonds,

7½% series, due 1998 (7.5 percent interest cost to

the Company).....\$100 million

SEPTEMBER

Common Stock,

4,520,000 shares sold through subscription rights

at \$20.50 per share......\$92.6 million

NOVEMBER

Industrial Revenue Bonds,

average interest rate of 5.5 percent, average

maturity of 16 years......\$40 million

In addition, \$1.6 million was raised through our employee stock purchase plan.

The common stock offering, which included a supplemental subscription privilege, was oversubscribed. As a result, subscribers under the supplemental subscription privilege received approximately 39 percent of the shares they subscribed for under the privilege.

The \$40 million of industrial revenue bonds were issued by the Delaware County Industrial Development Authority to finance pollution abatement projects and were secured by Philadelphia Electric Company notes.

Internally generated funds, totaling \$88 million, were provided mainly through depreciation, retained earnings, and deferred taxes.

Financing for 1973 began on January 22 with the sale of \$100 million of 7½% mortgage bonds, maturing in 26 years, at a net interest cost of 7.53 percent. Present plans for the remainder of 1973 call for the sale of additional issues of mortgage bonds, preferred stock, common stock, and industrial revenue bonds.

Commercial Operations

In 1972, marketing functions were realigned and reoriented within the framework of commercial operations with continuing emphasis on customer service. Simplified organization enabled us to arrange more effectively for the installation of new facilities for customers, to assist them to make most efficient use of our energy services, and to respond to the wide variety of requests we receive for information about anything from a home appliance to an energy system for a skyscraper. In keeping with the growing awareness that electricity is a valuable resource, commercial advertising was limited to suggesting ways to use energy wisely.

Electricity

The popularity of electric space heating continues to grow. During the year, 3600 electrically heated dwelling units were added to our lines and commitments were received for the future installation of electric heat in an additional 7900 new homes and apartments. Total commitments received in 1972 for residential, commercial, and industrial space heating amounted to 128,000 kilowatts, representing nearly \$4 million in annual revenue. The sale of this energy permits us to make desirable use of our existing generating capacity during off-peak periods.

Power requirements are accelerating in the increasingly important field of environmental protection. "Environmental" energy sales for pollution control, waste recycling, sewage treatment, and mass transit now account for an estimated 7 percent of our total kilowatthour sales and are expected to double in the next five years. Almost every step taken by industry to control its environmental impact or to recycle materials calls for additional electric energy.

The use of electric furnaces is growing in the steel industry. These are the cleanest furnaces available from an environmental standpoint and, moreover, are capable of operation with charges predominantly composed of reclaimed metal. One steel company in our territory has two new 200-ton electric furnaces scheduled for production early in 1973, and another major producer plans to install a 150-ton electric furnace for production in 1974.

Gas and Steam

As a result of the nationwide natural gas shortage and an order by the Pennsylvania Public Utility Commission restricting new gas sales, we were unable to accept any applications for new or additional gas loads after February 15, 1972. Consequently, installation of residential gas heat in 1972 was limited to 9500 dwelling units committed prior to that date.

Many builders, unable to obtain gas for residential developments, are turning to electric space heating. The impact of this transition and the effect of a similar trend in commercial construction will be felt in 1973 and 1974. Sixty-two percent of all new dwelling units built in our service area in 1972 use our gas or electricity for heating.

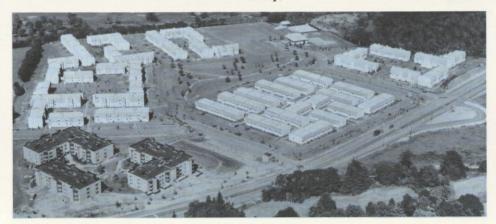

Our central steam system continues to grow in pace with the development of downtown Philadelphia. New contracts signed in 1972 included one for a large office building, converting from oil heat, and two for new skyscrapers. Ninety percent of the commercial and governmental space in center city is heated with Philadelphia Electric steam. We are actively seeking new steam air conditioning customers to balance our winter steam heating peak loads.

Blair Mill Village in Horsham Township typifies rapid growth of new communities in Philadelphia Electric's service area.

Blue Bell office campus in Whitpain Township marks trend toward business-oriented office centers in suburban surroundings.

All-electric apartment and town house development at Meadowbrook uses Philadelphia Electric energy exclusively.

Area Development

Demand for industrial space is strong in Philadelphia Electric's 2475-square-mile territory, hub of the rich northeastern corridor extending from Boston to the nation's capital.

During 1972, our area development specialists worked with 43 companies which established new or branch plants here, and with 85 companies which relocated or expanded their existing facilities. Real estate developers, recognizing the demand for industrial space, are investing large sums in a growing number of industrial projects.

A construction revolution is under way in Philadelphia. Many older center-city buildings are being replaced by new office and residential skyscrapers. Elsewhere in the city, 1000 acres of municipallyowned land are being made available for industrial development. Recent census figures show that in the decade of the 1960's the population of our territory in the suburban counties outside Philadelphia rose 21 percent, compared with a 13-percent increase for the nation as a whole.

Total Authorized.....

Electric energy sales totaled 25 billion kilowatt-hours in 1972, an increase of 4.5 percent over 1971. A new hourly peak demand of 5.3 million kilowatts was met on July 20, which exceeded the previous year's high by 8 percent. On the same day, a new peak demand of nearly 28 million kilowatts was supplied by the Pennsylvania-New Jersey-Maryland Interconnection of which Philadelphia Electric is a member. This new peak was 9 percent above the previous high recorded in 1971.

Generating Capacity

Eleven additional combustion turbines were ordered in 1972. Three of these units are of conventional design and are scheduled for service at Richmond generating station early in 1973. The other eight units, which are scheduled for operation early in 1974 at a site in Croydon, Bucks County, will be of advanced design and will recover a portion of the heat normally discharged to the atmosphere for a 16-percent reduction in fuel use. These additions will increase the number of combustion turbine units on our system to 55 with a total generating capacity of 1.7 million kilowatts.

Construction of two new 400,000-

kilowatt generating units is moving ahead at Eddystone station, the first scheduled for service in the spring of 1974, the second early in 1975. Both will burn either low sulfur residual or crude oil and fully comply with stringent ai quality regulations.

New Transmission Line

A new 500,000-volt transmission line between our Whitpain sub station and Public Service Electric and Gas Company's Branchburg substation in New Jersey was ener gized early in 1972. This importan connection was needed to improve the reliability of the transmission systems of Philadelphia Electric and the Pennsylvania-New Jersey Maryland Interconnection and to assure delivery of our share of the power output of the Keystone and Conemaugh mine-mouth gen erating stations in western Pennsylvania.

During construction of this line, we worked closely with the National Park Service, the Pennsylvania Public Utility Commission, the Delaware River Basin Commission and local government officials to insure that the line would be in stalled with minimum impact on the environment through careful routing, selective tree trimming

Operations

and use of ornamental structures. With the increasing difficulty of obtaining aerial rights of way, we are discussing the routing of necessary transmission lines with local government bodies well in advance of required service dates with the hope that open discussion will result in more acceptable routing and avoid delays stemming from public opposition.

General Meter Shop

The recent establishment of a new general meter shop near the geographical center of our territory at King of Prussia permitted us to design a production-type facility for calibrating and reconditioning electric and gas meters at one location. Automated equipment, precision testing devices, and modern storage and shipping techniques have already resulted in significant savings in manpower and costs.

Flood Damage

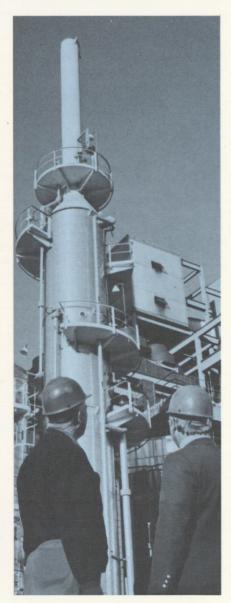

Tropical Storm Agnes in late June caused severe flooding in some areas of our service territory. Conowingo and Muddy Run hydro stations on the Susquehanna River and Cromby and Barbadoes steam stations on the Schuylkill River were taken out of service to prevent major damage by the flood-

waters. Electricity generated by other stations on our system was sufficient to supply the needs of our customers. However, substations at Pottstown and Conshohocken were put out of service when the waters reached an alltime high, which affected service to some customers in those areas. Units at Conowingo were out of service until repairs to the water intake compartments were completed. One unit at Barbadoes. scheduled for retirement, was not repaired. The cost of repairs to damaged facilities was approximately \$2.5 million.

Air Quality Control

Our expanding use of low-sulfur oil was accelerated in 1972 in keeping with our efforts to supply electrical energy with minimum effect on the environment. All fuel oil deliveries after July 31 had a sulfur content of 0.5 percent or less to comply with new municipal and state regulations. Major generating units at Delaware and Richmond stations were converted to burn low-sulfur crude oil, which is more plentiful and less expensive than residual oil.

Nuclear Power

The prototype high temperature gas-cooled reactor (HTGR) at our Peach Bottom atomic power station continues to operate very dependably since it was first placed in commercial operation in 1967. Total generation of electricity by the small 40,000-kilowatt unit was approximately 1 billion kilowatthours by the end of 1972. Because it has successfully served its purpose of demonstrating the feasibility of developing HTGR units of large size, several are on order.

New Units at Peach Bottom

Construction of two additional nuclear units at Peach Bottom moved ahead in 1972 to the extent that by year-end unit No. 2 was 95 percent complete, with commercial operation planned for the fall of 1973. Operation of unit No. 3, which was 60 percent complete, is scheduled for the fall of 1974.

Each of these units will have a General Electric boiling water reactor and turbine-generator rated at more than 1 million kilowatts. The application for an operating license, submitted to the Atomic Energy Commission in August 1970, is in the process of review.

The AEC issued a safety evaluation report in August 1972 and a draft environmental statement in October 1972. It is expected that the AEC will issue the final environmental statement in the first quarter of 1973.

Philadelphia Electric will have an approximate 42-percent interest in the ownership and output of these units and will be solely responsible for their operation. Public Service Electric and Gas Company of

New Jersey, Atlantic City Electric Company, and Delmarva Power & Light Company will share the remaining ownership and output.

Salem Nuclear Station

A similar ownership interest is held by Philadelphia Electric in the Salem nuclear generating station currently under construction on the Delaware River near Salem, New Jersey, by the same group of utilities. The plant will have two Westinghouse pressurized water reactors and generators rated at approximately 1,100,000 kilowatts each, the first unit scheduled for commercial use by the summer of 1975, the second a year later. Public Service will operate the plant.

Limerick Nuclear Station

In February 1970, we applied to the Atomic Energy Commission for a construction permit to build a nuclear power plant on the Schuylkill River, in Limerick Township, near Pottstown, Pa. Because of substantial changes in AEC regulations and prolonged public hearings, the AEC review of the construction permit application proceedings is not expected to be completed until the latter part of 1973. As a result of this extreme delay and delays in obtaining water, preliminary site preparation work, consisting of clearing, excavation, and grading, has been suspended since January 1972.

Public hearings were held on the radiological health and safety aspects of the plant during the spring, summer, and fall of 1972, and environmental aspects are expected to be covered when the hearings reopen in 1973. A draft environ-

mental statement for the project was issued by the AEC in December 1972. In the meantime, we have requested AEC permission to commence certain construction work at the plant site prior to the issuance of a construction permit.

Two General Electric boiling water reactors and associated turbinegenerators, each with a capacity of more than 1 million kilowatts, have been purchased for the plant. They are essentially duplicates of the nuclear units being installed at Peach Bottom. Operation of the first unit is tentatively scheduled for 1978, the second for 1980.

HTGR Nuclear Station

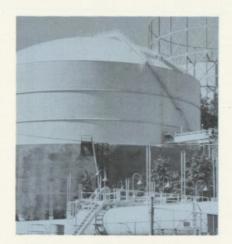

Engineering went forward in 1972 for the high temperature gas-cooled reactor plant we plan to have ready for operation in 1981 at a location yet to be determined. This 2.3-million-kilowatt station, using two HTGR units, is expected to have the highest operating efficiency of any large commercial nuclear plant in the world. Peach Bottom unit No. 1 was the prototype of today's full-scale HTGR units.

The HTGR system, which has been developed by Gulf General Atomic Company, has strong environmental advantages in that it produces a low heat discharge comparable to the most efficient fossil plant available today. Moreover, the station will have cooling towers which will further protect the environment from waste heat discharge. Current evaluations indicate the new station will generate electric energy at lower net cost than any other means now commercially available.

Gas Operations

With supplies severely limited by the national gas shortage and as a result of the restriction placed by the Pennsylvania Public Utility Commission on the acceptance of new gas loads, gas sales showed only a small increase of 2.5 percent to 70 billion cubic feet in 1972. The record daily sendout for the year, which occurred on January 16, was 390 million cubic feet, just below the all-time high of 396 million cubic feet recorded in 1971.

Despite curtailment of 8 percent in our 1972 contracts with gas pipeline companies, we are supplying the full requirements of all firm contract customers. Our ability to meet this demand is primarily due to the completion in 1972 of our new liquefied natural gas plant at West Conshohocken, which will provide an estimated 790 million cubic feet of peak load gas during the 1972-1973 heating season. This plant eventually will store up to 1.2 billion cubic feet of natural gas and is capable of providing up to 200 million cubic feet of gas a day during periods of peak demand. Substantial quantities of propane have also been purchased to help supplement the pipeline supply. We are actively investigating alternative sources of gas supply, such as the conversion of naphtha and other petroleum products to gas, the importation of liquefied natural gas, and the manufacture of gas from coal.

Steam Service

Steam sales increased 1.3 percent to 8.3 billion pounds in 1972. The maximum hourly sendout for the year was 2.5 million pounds on January 17, down from the record sendout of 2.7 million pounds an hour set in 1971 during colder weather.

A new 600,000-pound-per-hour boiler at Schuylkill electric generating station is being completed for service early in 1973. Operating economies will be realized from using the output of this boiler for generating electricity as well as for steam service.

Top Storage tanks at West Conshohocken provide reserve gas supplies to meet cold weather demands.

New pollution control equipment is
added to existing coal-fired generating
unit to further improve air quality.

Research Programs

We are stepping up our annual research and development expenditures from approximately \$3 million in 1972 to an anticipated \$4.4 million in 1973, including a substantial commitment to the development of the liquid metal fast breeder reactor. This advanced reactor when fully developed will greatly extend the supply of fuels for fission reactors and will have substantially improved efficiency compared with present-day nuclear plants. We are also supporting the development of the gas-cooled fast breeder reactor as an alternate approach to an efficient fuel-producing nuclear plant.

Fuel Cells

We are participating with a number of other utilities and the Edison Electric Institute in a major program to develop a fuel cell for electric utility application. The fuel cell, which provided power to the Apollo spacecrafts during flights to the moon, combines hydrogen and oxygen to produce electricity at high efficiency. Its only effluents are pure water and carbon dioxide. The development of a successful fuel cell for use by electric utilities would offer the additional advantage of locating a portion of the generation facilities in the immediate vicinity of major

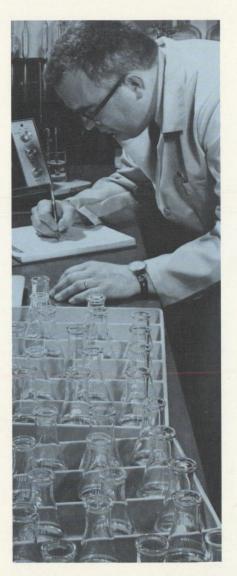

load centers, thereby reducing some of the need for costly facilities for power transmission.

Fusion

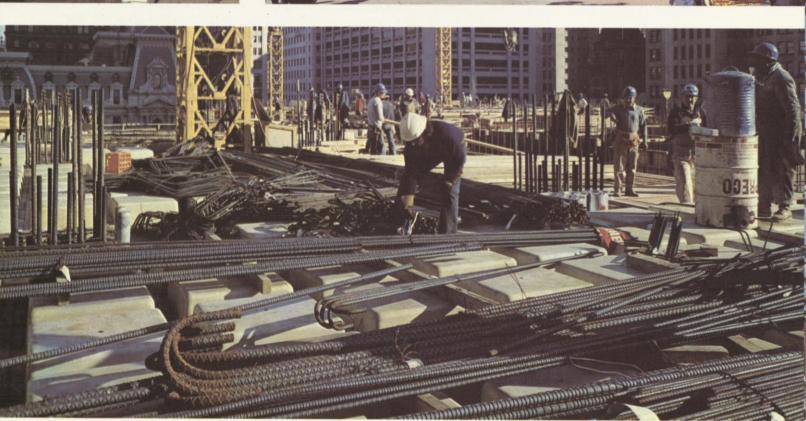

Controlled thermonuclear reaction, or fusion, is a new potential source of energy receiving much attention. Harnessing fusion, the reaction that sustains the sun and the stars, would provide a virtually inexhaustible fuel supply, together with the possibility of converting energy at very high efficiency. Through the Edison Electric Institute, we are supporting fusion research programs at Cornell University, the University of Texas, and the Princeton Plasma Physics Laboratory.

Flue Gas Research

We are pursuing the development of two different systems for removing sulfur oxides from flue gas. One is located at our Cromby generating station, and a second research project has been initiated at our Eddystone generating station, both aimed at removing sulfur oxides and particulates from coalfired boiler flue gas. If these projects prove successful, large reserves of high-sulfur coal could be used for power generation with minimum impact on the environment.

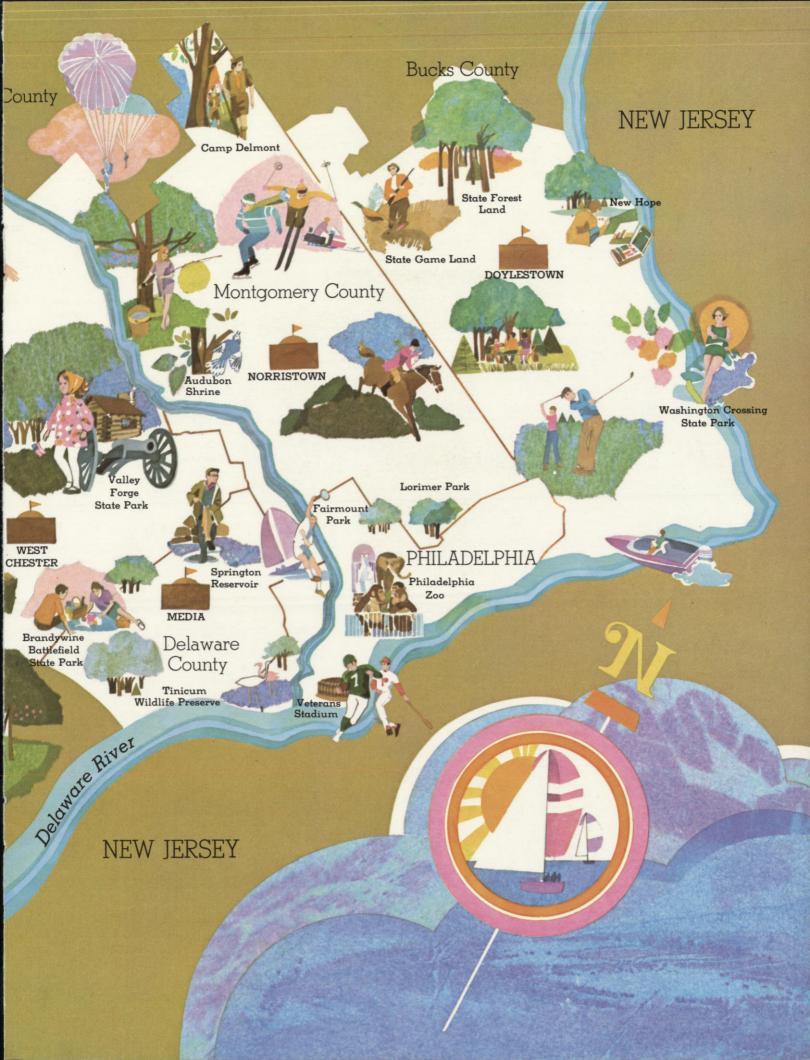

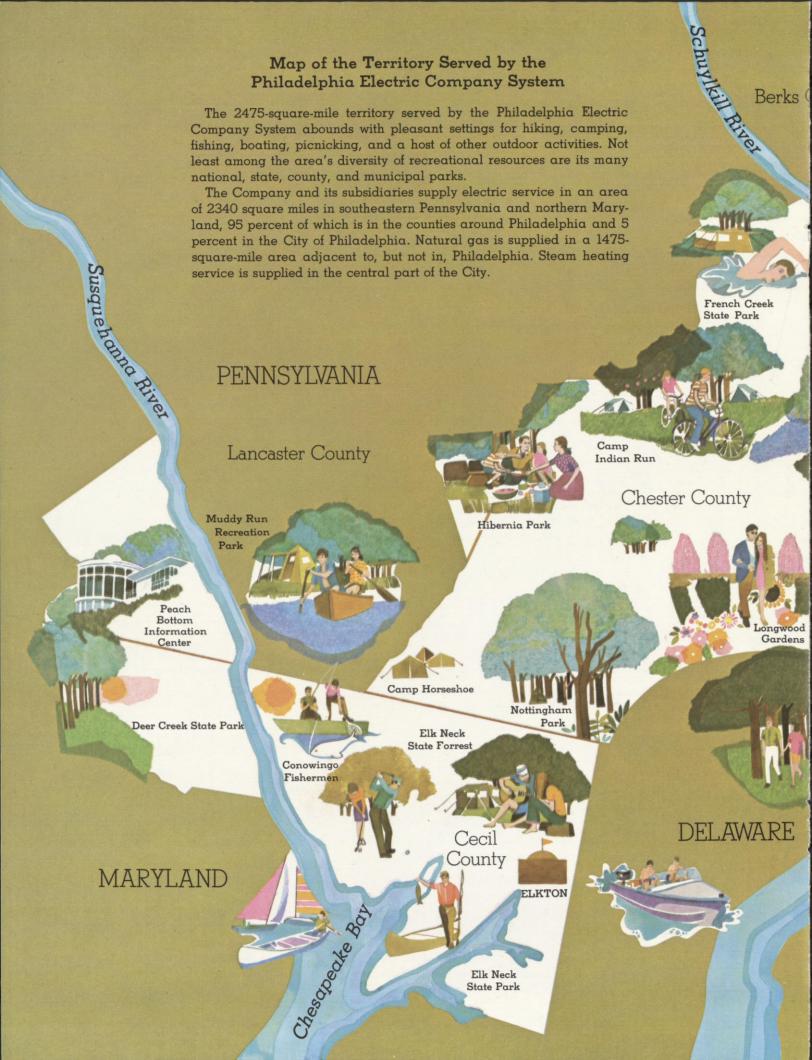

Water discharged from our generating stations is constantly checked to protect the streams in our service area.

Information Programs

To develop better public understanding of our operations, a 13-week series of television commercials was shown in the spring and repeated in the fall of 1972. The series discussed honestly and openly some of the challenging operating problems we face and what we are doing to solve them. The commercials included frank criticisms of the Company by customers as well as constructive answers to questions most frequently asked about our operations.

Reaction to the campaign was extremely favorable. An independent opinion research organization reported the hard-hitting commercials were outstandingly effective in creating a better public attitude toward the Company. A followup program is in preparation for use in 1973.

Speakers Bureau

Through a recently organized women's branch of our speakers bureau, qualified female employees of the Company join an experienced group of men who meet and talk with various groups and organizations on subjects dealing with Company aims and accomplishments, and on timely public service topics. The bureau's expanded lecture program is designed to present in easy, nontechnical ways helpful information on ecology, the environment, atomic energy, safety, and hints of consumer interest for the home.

Information Centers

Our two atomic information centers—one permanently located at Peach Bottom and the other a mobile unit open to the public on a rotating schedule at population centers in Montgomery and Chester Counties—continue to attract thousands of visitors. "Atomic Energy, The Key to Your Future," a lecture-demonstration program, continues to be a popular educational presentation in the schools of our service area.

Young visitors explore exhibits in one of Philadelphia Electric's atomic information centers.

Power and Environment

We are committed to meeting the energy needs of our customers and, at the same time, to protecting the quality of our environment to the limits permitted by current technology. We will, therefore, do our utmost to minimize the environmental impact of all new installations and continue to improve the performance of our existing facilities. From a technological standpoint, we can build any kind of power plant. However, our objective is to build plants that will best serve our customers.

Nuclear Power

We know, not just from the record of the electric utility industry, but from our more than twenty years of first-hand experience, that nuclear power is safe, clean, economical, and reliable. That is why we have selected nuclear power for our next generation of power plants.

Nuclear generation is not without its critics. Although their number is small and their claims are refuted by the preponderance of technical expertise and experience, these critics seem to have no difficulty spreading their prophecies of disaster.

It is a fact, however, that the safety

of nuclear power operations has been established in the judgment of the large majority of knowledgeable scientists and engineers, and by the Atomic Energy Commission, which is responsible for assuring that plants are designed, constructed, and operated safely. The safety of nuclear power has also been demonstrated by the excellent operating record of nuclear power plants both here and abroad. Civilian and naval nuclear power plants have recorded over 1000 reactor years of operating experience without a single injury or fatality attributable to the nuclear nature of the plants.

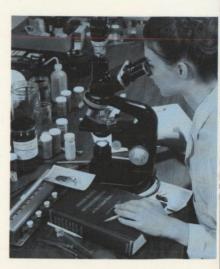

Construction Delays

In spite of the importance of electric power to the nation's well-being. we, and electric utilities in general, face unknown delays in the service dates for new plants. Both fossilfuel-fired and nuclear plants are being delayed for months and even years by a proliferation of new laws, new regulations, and new agencies requiring the filing and review of voluminous information relating to the environment, despite the fact that our Company's new facilities are designed to meet or exceed every new environmental criterion or requirement.

We are just as concerned about the environment as the agencies that regulate us. What we seek are reasonable standards and a prompt review so that we can meet all regulatory requirements without delay.

Water Quality

Maintaining and improving water quality in the streams of our service area is our continuing concern. The design of new waste water treatment systems for Delaware and Eddystone stations is nearing completion and the installation of additional facilities to supplement purification systems presently in use at other locations is under study.

lant and the construction of the ewnuclear units at Peach Bottom, in ecological study of the Susqueanna River has been under way or some time by Ichthyological associates under the direction of in Edward C. a connection with the operation of

ur Muddy Run pumped-storage

Power and Recreation

A portion of the main reservoir at our Muddy Run pumped-storage plant was opened for fishing in 1972, adding to the already extensive opportunities for fishing adjacent to the plant. The recreation park at the upper end of the reservoir has provided an ideal setting for family camping, fishing, boating, and picnicking since it was opened in 1969. Its facilities include 164 campsites for tents and trailers, a picnic area with 250 tables, play areas, and boats for use on the 100-acre recreational lake. Appropriate charges are made to provide for operating expenses.

Our Conowingo fishermen's park,

twelve miles below Muddy Run at Conowingo Dam, is another popular recreational spot on the Susquehanna River visited by thousands of fishermen and their families each year. Its attractive split-level pavilion overlooking the tailrace area below the powerhouse has food-vending machines, outlets for electric cooking, modern restrooms, and heat lamps for cold weather comfort.

The promotion of outdoor recreation at our hydroelectric properties on the Susquehanna is in keeping with our longstanding policy of developing the full recreational potential of Conowingo Lake for the enjoyment of the public.

Management and Personnel

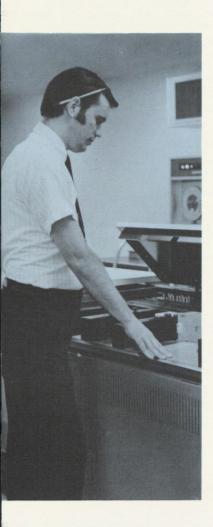

Roy G. Rincliffe, chairman of the executive committee since 1963, has voluntarily withheld his name from nomination for re-election to the board of directors. Mr. Rincliffe began his career with Philadelphia Electric in 1923 and rose through the ranks to become president in 1952. He served as chairman of the board from 1962 until his retirement in 1969. Active in civic and business affairs, and an ardent worker and booster for the welfare and improvement of Philadelphia, Mr. Rincliffe was nationally known for his advancement of the art of steam generation at the Company's Eddystone station, and for leading Philadelphia Electric into the nuclear era with the building of the Peach Bottom atomic power station, a pioneer project in the nation's nuclear power program.

On April 1, 1972, J. Henry Long, senior vice president and former vice president of gas operations. retired after 45 years of service with the Company. During his long career, Mr. Long was widely known for his leadership in the gas utility industry.

On January 22, 1973, at a regular meeting of the board, William T. Coleman, Jr., senior partner in the Philadelphia law firm of Dilworth, Paxson, Kalish, Levy & Coleman, was elected a director.

People are important at Philadelphia Electric and its successful operation stems largely from the loyalty and competence of its more than 10,400 employees.

In addition to being an equal opportunity employer, the Company sponsors many programs beneficial to minority groups, including several designed to prepare disadvantaged persons for employment. Its longstanding policy has been to recruit, hire, and consider for promotion qualified employees for all job classifications without regard to race, color, religion, sex, or national origin. Twenty-eight percent of our new employees hired during 1972 were from minority groups, which compared favorably with the 20-percent minority population in our service area.

Notes to Financial Statements-Thousands of Dollars

1. Significant Accounting Policies

Depreciation and Deferred Income Taxes. For financial reporting purposes, the Company provides for depreciation over the estimated service lives of the plant on a straight-line basis. Higher depreciation deductions are taken for tax purposes based on the use of a liberalized method of com-

puting depreciation and of shorter lives permitted by the Internal Revenue Service. Income tax deferrals, reflecting this higher depreciation on certain plant additions prior to December 31, 1969, have reduced operating expenses in accordance with the regulatory commission treatment for rate-making purposes. However, beginning in 1971, the Com-

pany has normalized the effect of tax deferrals resulting from the continued use of double declining balance tax depreciation on plant additions after December 31, 1969, which increase system capacity, in accordance with the 1969 Tax Reform Act and the policy adopted by the regulatory commissions in 1970. The Company is also using the Class Life System (ADR) pro-

vided by the 1971 Revenue Act for tax depreciation purposes on plant additions after January 1, 1971, and is normalizing the resultant tax deferrals. The adoption of normalization of these tax deferrals for 1971 and subsequent years reduces tax deferrals that flow through to income and increases normalization charges (deferred income taxes—\$4,766 in 1971 and \$8,412 in 1972) as new plant is added to the system.

The balance of accumulated deferred income taxes at December 31, 1972 consists of (1) deferred income taxes (\$11,438) applicable to plant installed in 1950-57 and subject to five-year amortization pursuant to certificates of necessity, which are being credited to income over the remaining life of the related plant; (2) the income tax deferrals (\$13,178) on plant additions after December 31, 1969, resulting from higher depreciation deductions for tax purposes, than those used for financial reporting purposes, which will be credited to income in years when depreciation deductions for financial reporting purposes exceed those deductible for tax purposes; and, (3) the unamortized balance (\$5,475) of an income tax refund which resulted from higher depreciation deductions for tax purposes in prior years due to the retroactive application of guideline lives.

Investment Tax Credit. Federal income tax expense reflects reductions of \$4,065 for 1972 and \$3,748 for 1971, representing the investment tax credit arising from the investment in new plant placed in service during these years. These tax reductions are deferred by equivalent charges to income and subsequently amortized by credits to income over a five-year period for investment tax credits at the former three percent rate, and over the estimated useful life of the utility plant for credits at

the present four percent rate under the Revenue Act of 1971.

Allowance for Funds Used During Construction. Allowance for funds used during construction represents the estimated net cost of funds used for construction purposes. In accordance with regulatory systems of accounts, the allowance is included as a cost of construction in the plant accounts and as "Other Income" in the Consolidated Statement of Income for financial reporting purposes; however, for income tax purposes, the allowance is not included in taxable income. The effect on income taxes, to the extent not offset by a related reduction in depreciation expense for tax purposes, is reflected in income.

Increased Rates. Rate increases are reflected in revenues as billed from dates authorized or permitted to become effective by regulatory authorities. See text of this report, "Rate Increases," on page 4.

2. Utility Plant

Utility plant includes construction work in progress of \$751,014 and \$542,228 at December 31, 1972 and 1971, respectively. Construction expenditures for the year 1973 are estimated at \$523,000.

3. Pollution Control Funds Held by Trustee

In 1972, the Company entered into a Pollution Control Facilities Agreement with the Delaware County Industrial Development Authority under which the Authority has agreed to finance certain air and water pollution control facilities at the Company's generating stations through the issuance of one or more series of the Authority's Pollution Control Revenue Bonds.

On November 22, 1972, in the first financing under the Pollution

Control Facilities Agreement, the Authority issued and sold \$40,000 principal amount of its Pollution Control Revenue Bonds, 1972 Series A, and the Company issued to the trustee under the indenture securing such Revenue Bonds its corresponding \$40,000 Pollution Control Note, Series A, payable in annual installments during the years 1974 through 1999 at an effective annual interest rate of approximately 5.5 percent. The funds are on deposit with the trustee, subject to requisition by the Company as expenditures are made for facilities.

4. Long-Term Lease Agreement

Under a 25-year lease agreement which began in 1971, the Company leases 17 combustion turbinegenerators, costing approximately \$40,000, at an annual rental of \$3,800.

5. Pension Plan

The Companies have a noncontributory service annuity plan applicable to all regular employees. The annuities are determined under a formula which is applied uniformly to all employees regardless of position, and the amount depends on length of service and compensation earned to normal retirement age. The annuities are paid out of an irrevocable trust fund, to which the Companies make annual contributions sufficient to meet actuarial requirements. Actuarial studies, which take market appreciation of securities into consideration. indicate that the requirement for prior service cost is approximately fully funded. Contributions by the Companies for future annuities aggregated \$8,020 in 1972 and \$6,935 in 1971 of which approximately 26 percent associated with construction labor was included in the cost of new utility plant.

Report of Accountants

To Shareholders and the Board of Directors, Philadelphia Electric Company, Philadelphia, Pennsylvania

We have examined the consolidated balance sheet of Philadelphia Electric Company and Subsidiary Companies as of December 31, 1972, the related statements of income, retained earnings and changes in financial position for the year then ended. Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances. We previously examined and reported upon the consolidated financial statements of the companies for the year 1971.

In our opinion, the aforementioned consolidated financial statements present fairly the financial position of Philadelphia Electric Company and Subsidiary Companies at December 31, 1972 and 1971, and the results of their operations and the changes in their financial position for the years then ended, in conformity with generally accepted accounting principles applied on a consistent basis.

30

⁽B) Shares sold in 1971 and 1972 were 2,500,000 shares June 1971 at \$21.25 per share, 2,508,575 shares September 1971 at \$20.00 per share, 4,520,000 shares September 1972 at \$20.50 per share and 71,494 shares during 1972 under the Employee Stock Purchase Plan at an average of \$22.71 per share. At December 31, 1972 there were 328,506 shares reserved for issuance under the Employee Stock Purchase Plan.

⁽B) Includes \$13,495 due within one year to meet bond maturities and sinking fund requirements.

^{*}Reflects reclassification of customers from small commercial and industrial to residential (14,442 in 1969).

*Reflects reclassification of 2,976 customers from commercial and industrial to residential and house heating in 1969.

**The reduction in customers in 1970 and 1971 reflects the phasing out and shutdown on October 15, 1971, of steam heating service (less than \$300,000 annual revenue) in the Borough of West Chester, Pa.
